Why this is important 4: Installability

- PWA "Install to Homescreen" prompt

  - HTTPS

  - App Manifest

  - S.w. is most difficult prerequisite

- User prompted to install only **after** he's shown evidence of repeated use

Coding & Debugging

- requires HTTPS - use surge.sh (or other) to test

- Use ES 2016

- Register s.w. using requestIdleCallback()

- Use service-worker-mock (on npm) to run unit tests in Node.js

- close tab completely for new version; not reload
